The Politicoptical Illusion

(7 November 2026)

Analyzing election returns in two of the largest states.

TEXAS

In Texas, a **Blue** **Governor** was elected with **52.8%** of the vote.

In Texas, a **Blue** **Senator** was elected with **55.1%** of the vote.

In Texas, out of 38 **House Representatives**, **14 Blues** (***36.8%***) and **24 Reds** (***63.2%***) were elected with as many as **52.9% Blue** votes and as little as **47.1% Red** votes.

For the Blue Texans, over half the votes returned only a tad over one third of the seats.

However, to compound the issue, nearly half the registered voters did not vote in Texas (7 in 10 of the overall population).

CALIFORNIA

In California, a **Blue** **Governor** was elected with **65.28%** of the vote.

In California, there was no election of a Senator.

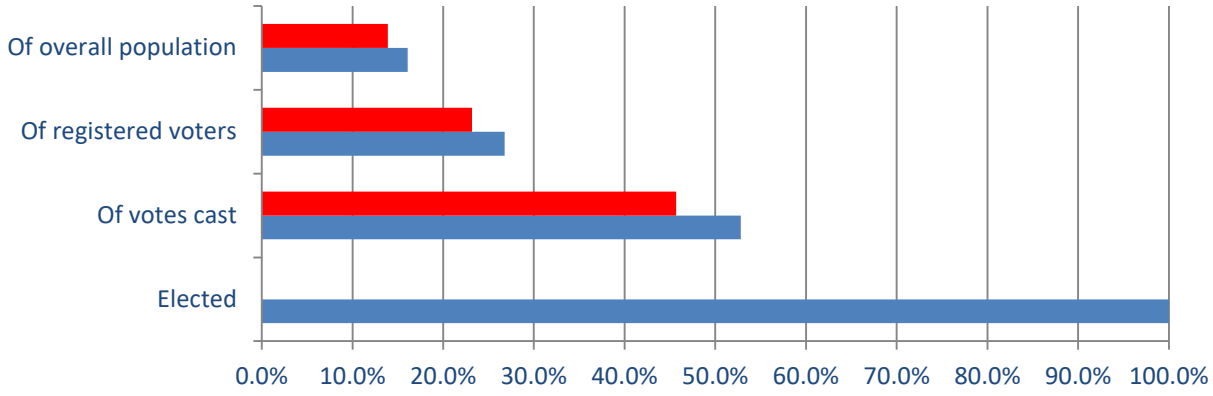

In California, out of 52 **House Representatives**, **48 Blues** (***92.3%***) and **4 Reds** (***7.7%***) were elected with only **68.8% Blue** votes and as many as **31.2% Red votes**.

For the Red Californians, it took almost a third of the votes to return one in thirteen seats.

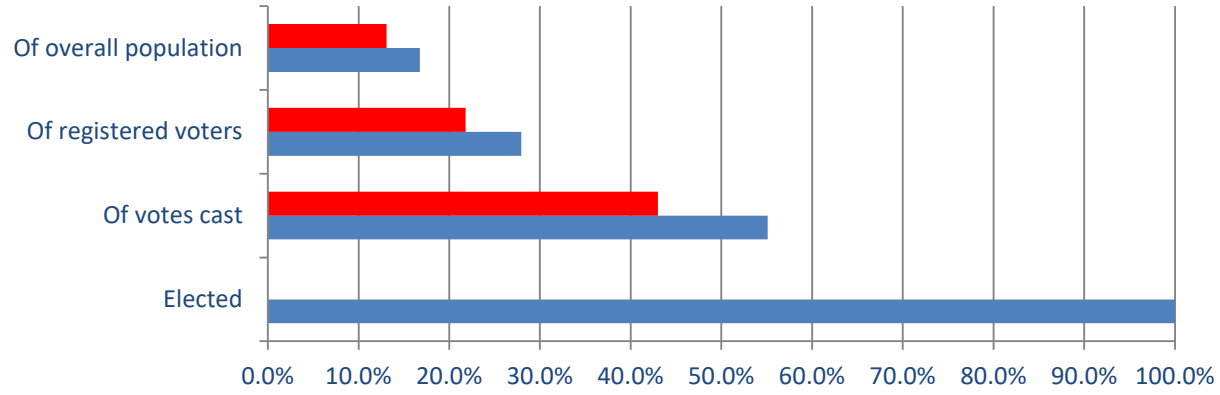

However, to compound the issue, nearly 6 in 10 registered voters did not vote in California (three quarters of the overall population).

Can one assert with certainty each state's actual complexion? Couldn't it be that Texan Blues prevailed in part because many Reds stayed home rather than cast their ballot for Red candidates and/or their endorser to whose personalities they may have objected from a moral standpoint?

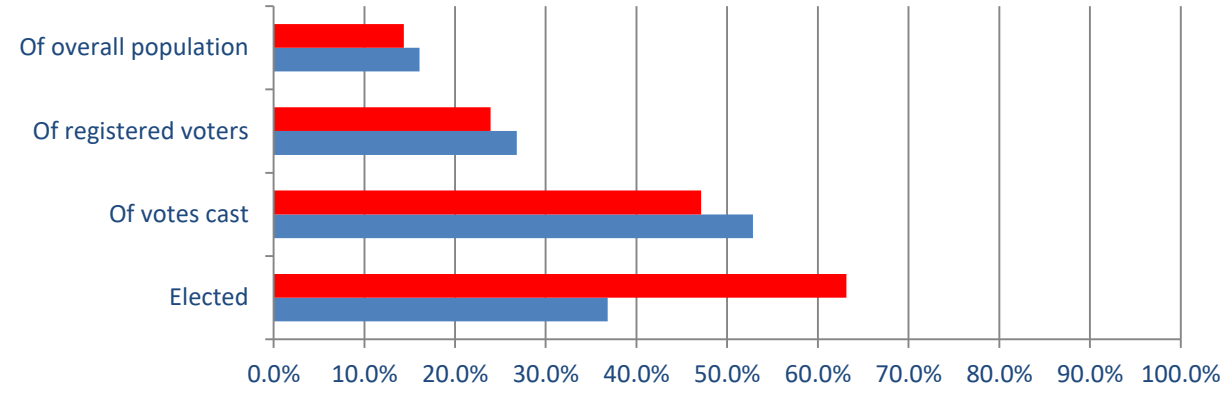

Texas: Governor

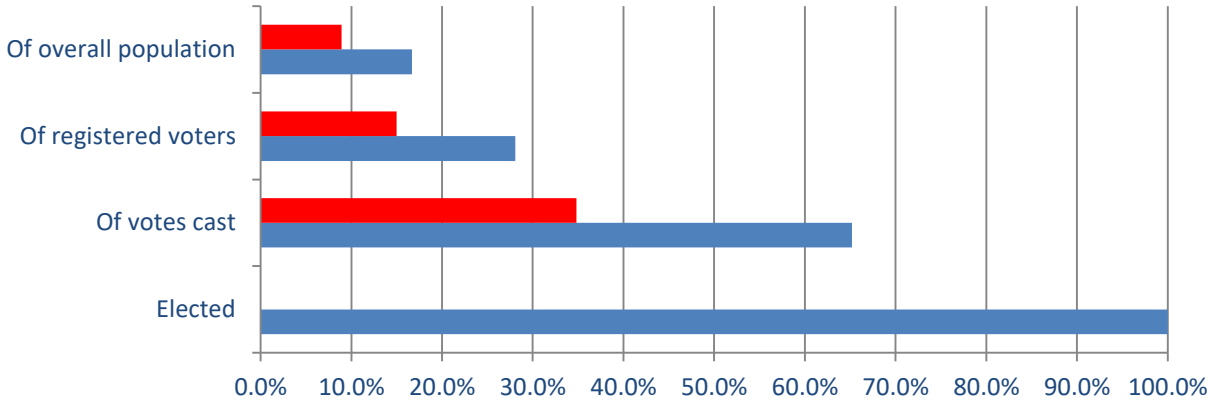

Texas: Senator

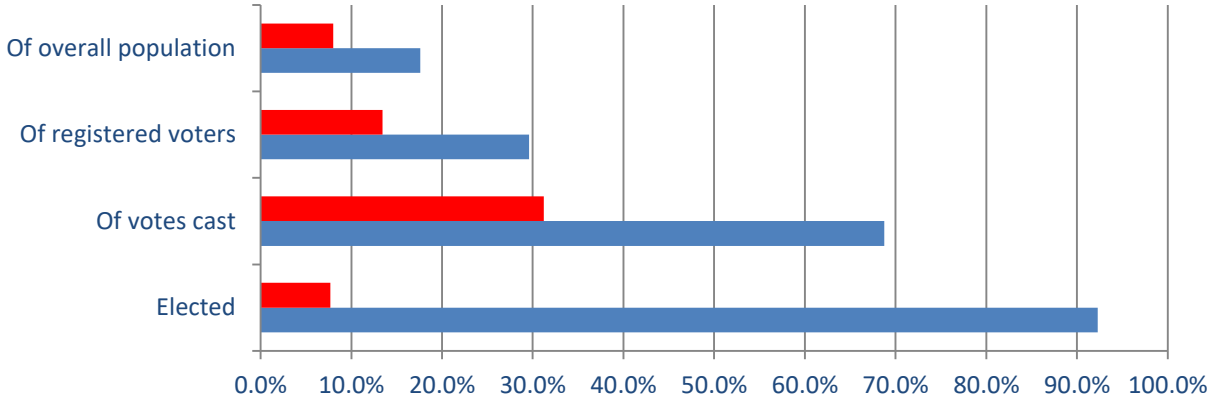

Texas: U.S. Representatives

California: Governor

California: U.S. Representatives

Is rejecting the preacher tantamount to rejecting the creed?
